Am Uebergestadt (Switzerland) and Milano (Italy) and received back For Mr. Weber

With all spine-bundles one must observe, that the lowest spine is lighter(a), whereas the two next to it, pointing sideways downward (b) are dark; with some figures this is good but with most too little observed, thus specially with the topmost. The spine (c) is also dark, all of them lighter below.; further the spines, primarly the stronger

ones have edges. I pointed this out to Mr. Weber at the time. the pen-

cil drawing is perhaps not clear enough, but should be compared

again, specially concerning the shading of the spines. Further, these

spines are distinguished through a thickening of the base;, which must

be indicated better for several; only for the middle spine figures

the rich, young wool covers the base of the spines.

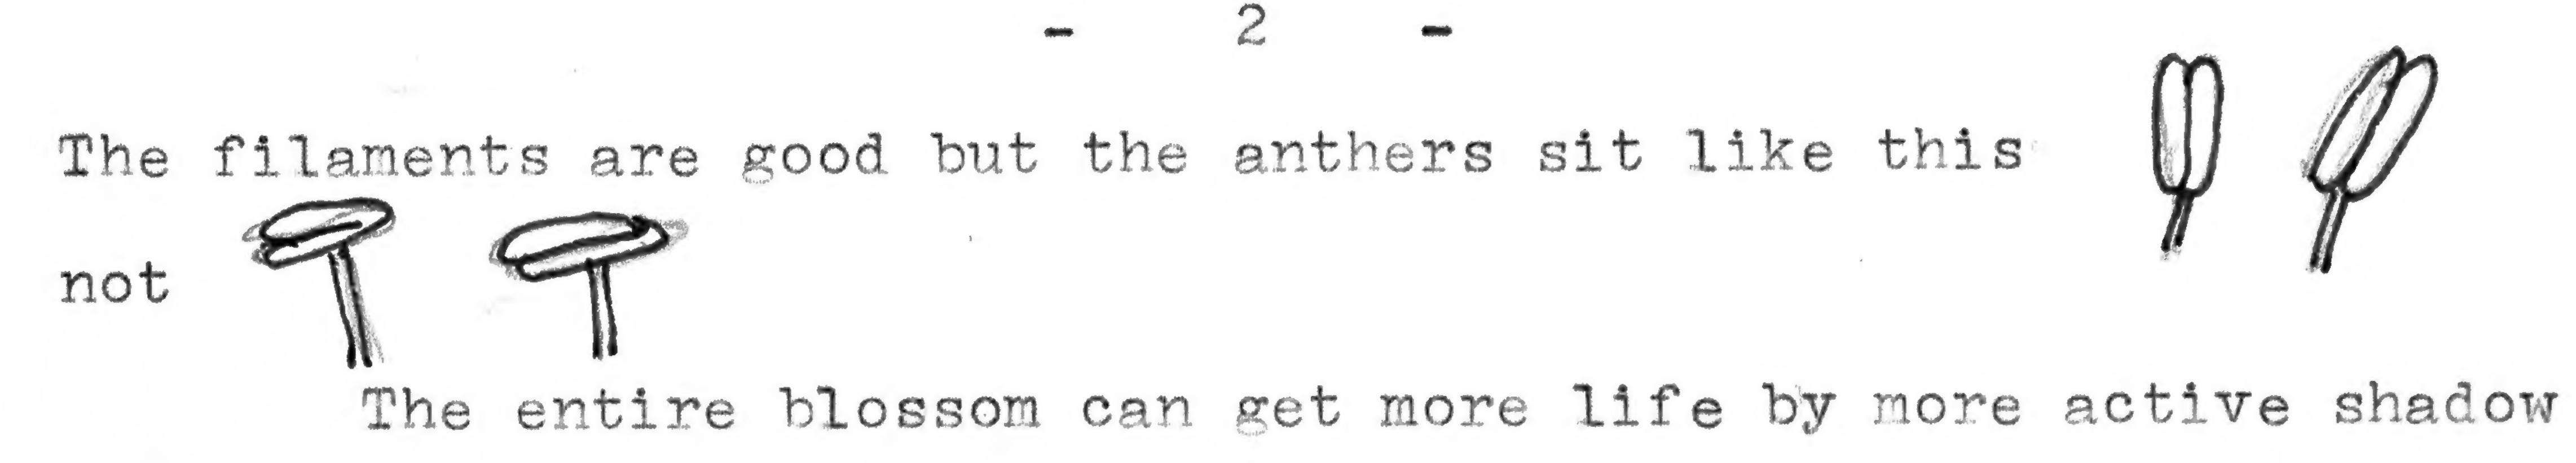

The spines, which I have marked thus ? seem to be too dark.

The pistils of the flower are good, only the outer indetation or fur-() or rather thus. (()) row should be extended to the bottom The shading of the floral tube is not as I desire it; it should

be much more rounded with more shading on one side, but the spones, as far as they are in the light must be lighter; also the scales, which are visible below the uppermost spinebundles, must be demarkated more JU/ distinctly. Compare the earlier flowering picture. I befieve, that if what should be darker, would be more enclosed (also the spines which are marked (b) and (c), the difference would become more apparent. and the entire picture would improve. Many of the spones, which terminate so needle or bristle-like thin must become stronger; see (c); I believe that these figures

are misleading specially on account of their slim spines. The spine (f) below right is apparently too pale. The middle-spones, designated (c) show a base like this: I assume it should be like so : Compare the drawing.

giving; there is something dull similar to pencil.

Compare the Paris steel engravings.

MISSOURI BOTANICAL GARDEN GEORGE ENGELMANN PAPERS

Frankfurt am Main Nov. 29,1857

Mister Weber,

I hope you addressed yourself industrially to the plates, and can send to me soon a proof-print, at least of one. If, however, you cannot work any faster than on the two first ones, I won't be able to give you any more; but I would like if you would finish with the two you are working with, to work on another pair for me.

If you want that, then you would have to stick to it. The #5 for the next plate as well as the #2 you shall have as soon as I will have to pay you more. The plate arrived yesterday in quite good condition, though it was not packed very well as it laid loose in much too large a case.-Respectfully Your

Dr. G. Engelmann
